

How It Works

The SEE graphics process — kickoff to final render

What happens at each stage, and what we built for it. Green = automated now · Grey = still a person's job.

🔑 **The trick:** the booth file is defined **once** — straight from the 3D drawings (stage 2). Stages 3–5 all read from it, so the templates, the client spec sheet, and the artwork checks **can never disagree** with each other.

📊 **Across every job:** a **job dashboard** shows each active job's stage (intake → awaiting confirm → in proof → approved), its due date, and risk flags (an unconfirmed size, a failed check, an approaching deadline) — built from the booth files and the proof log, so it always matches the tools above.

🕒 **Coming (the one piece left):** a client portal that hosts all of the above in one place — clients upload, approve, and pay online. **future project**

Southeast Exhibits & Events · Pairs with the **Graphics Design AI Brief** (what each stage fixes) and the **Instructions** (how the team runs each step).
